

Welche Daten und Messwerte werden gespeichert?

When a person takes a measurement with the Kentix SmartXcan, readings are stored. These readings include the measured body temperature, the measurement distance and the date and time. The SmartXcan's system settings can be used to deactivate the storage.

If an RFID-enabled device is used, the stored data is assigned to the respective UID. This allows accurate control and assignment of measured values. For more information about SmartXcan RFID, [click here](#):
