

# SD-Karten mit 128GB in Kentix-Geräten

The Kentix devices AlarmManager, MultiSensor-LAN and AccessManager offer the possibility to record video images on an SD card.

For this purpose, an SD card with up to 128 GB must be inserted into the respective device.

Cards with a size up to and including 64 GB are recognized directly. If required, formatting is also offered automatically if the existing file system is incorrect.

For cards with 128 GB, the recognition does not work if the file system is different. The card must then be preformatted externally with another system (Windows PC, Mac). The required file system is FAT(32).

After formatting, the card can then be inserted back into the device and used to its full extent as normal.
