

Wieviele Zylinder kann ich miteinander vernetzen und wie ist der Netzwerkaufbau?

Up to 16 online locking cylinders can be taught-in on each AccessManager. Communication is via radio. The AccessManagers are simply integrated into the network via LAN (PoE).

The special feature of the Kentix access system is that up to 999 AccessManager can be networked with each other. This makes even large access systems very easy to implement. Management is carried out only through an AccessManager defined as the master.

The main advantage is that each AccessManager operates decentralised and manages the respective locking cylinders, even if the network is malfunctioning. The range between the online cylinder and the AccessManager should not exceed 25m.
