

An access profile defines the times and DoorLocks at which a user may have access.

Access profiles contain times at which access is granted and, on request, profiles for exceptional days (closing days).

Users are granted access by assigning access profiles in the user control system.

At the same time, the access profiles must be assigned to the DoorLocks for which these profiles are to apply. This can be done in the access profile settings and the DoorLock settings.

For example, it can be specified that a user only has access to a certain area during office hours and that no access is permitted on closing days.

If a conflict arises during access booking as a result of different time profiles, the profile that allows access takes precedence.

In order to avoid increased effort when using access profiles, a profile structure should be planned in advance. This can be done by department, security level or user function.
