

To benefit from the latest features, improvements and security updates, it is important to update KentixONE regularly. Regular updates rectify possible errors and improve the performance and stability of the system.

The latest software can be downloaded manually from the [homepage](#) or, with a valid KentixONE-GO license, automatically via the online software update function.

The device in Main Device operating mode and the taught-in devices in Satellite Device operating mode are listed with the software versions in a tabular view. This means that the system can always be kept up to date with little effort.

In addition, KentixONE offers the option of managing all connected satellites via the main device. The latest software for the satellite devices can be loaded onto the SD card inserted in the main device "Manage update files". As soon as the update of the satellite devices has been started and the corresponding software has been uploaded, all satellite devices are updated in the background. The update process is controlled by the main device.
